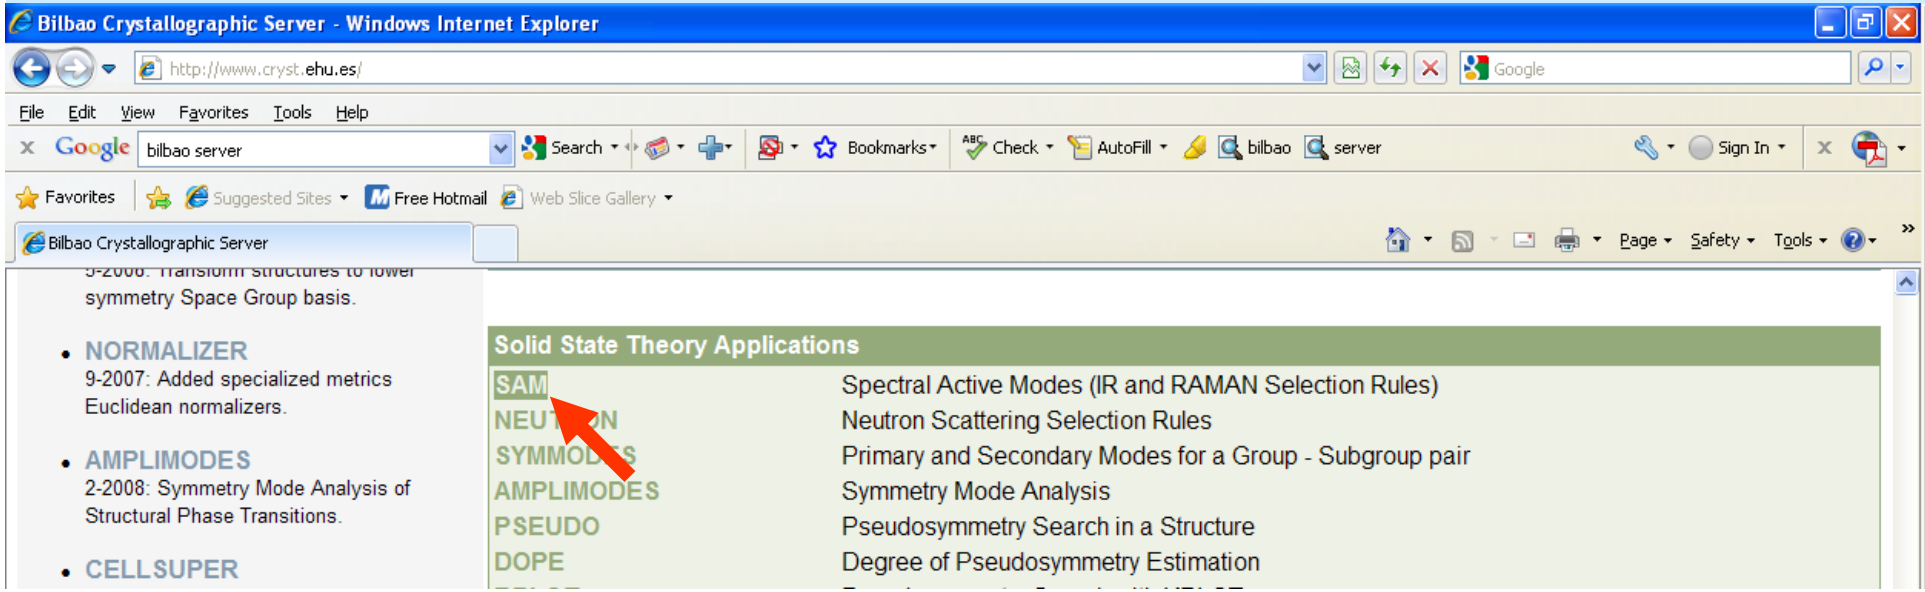
Lekeitio, Spain, 21-27 june 2009

Outline

1. **The dynamics of atoms in crystals. Phonons**

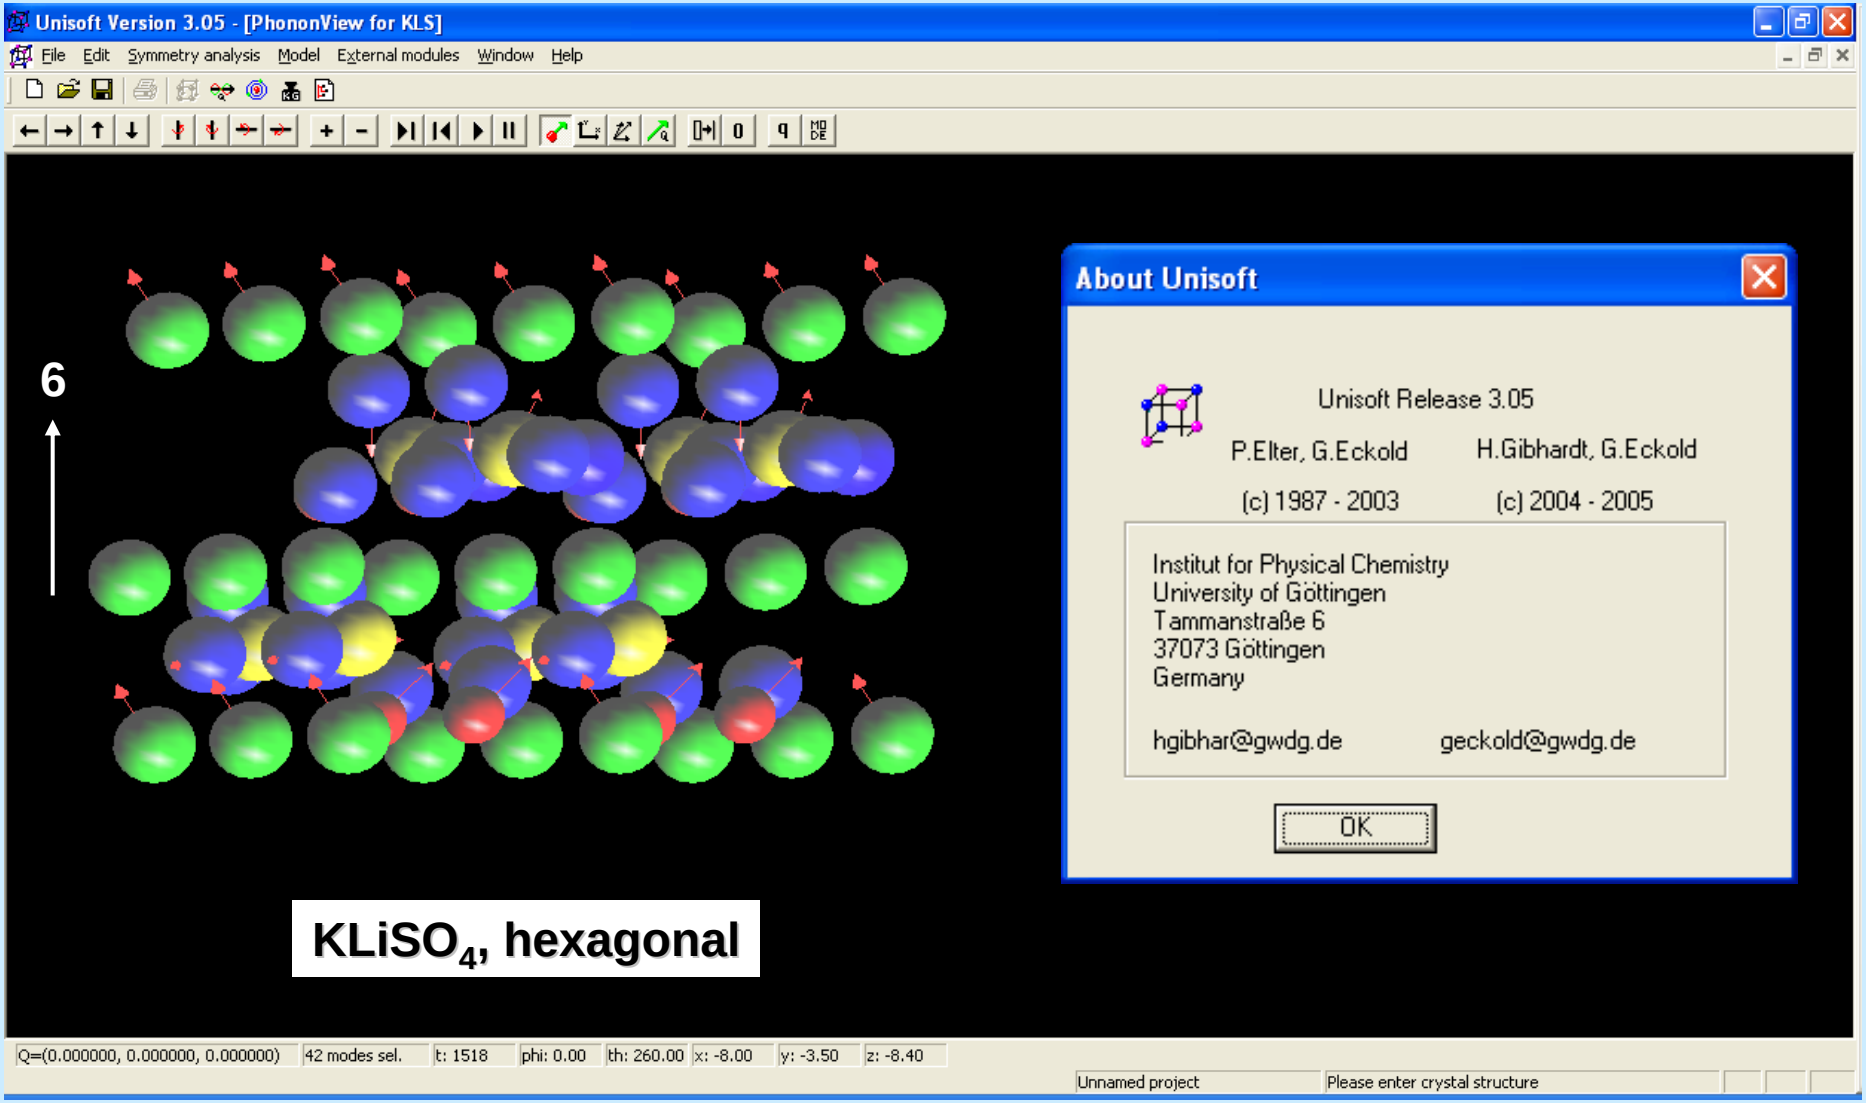
2. **Raman and IR spectroscopy :**
   most commonly used methods to study atomic dynamics

3. **Group theory analysis :**
   phonon modes allowed to be observed in IR and Raman spectra



Atomic dynamics in crystals

Visualization: UNISOFT, Prof. G. Eckold et al., University of Göttingen

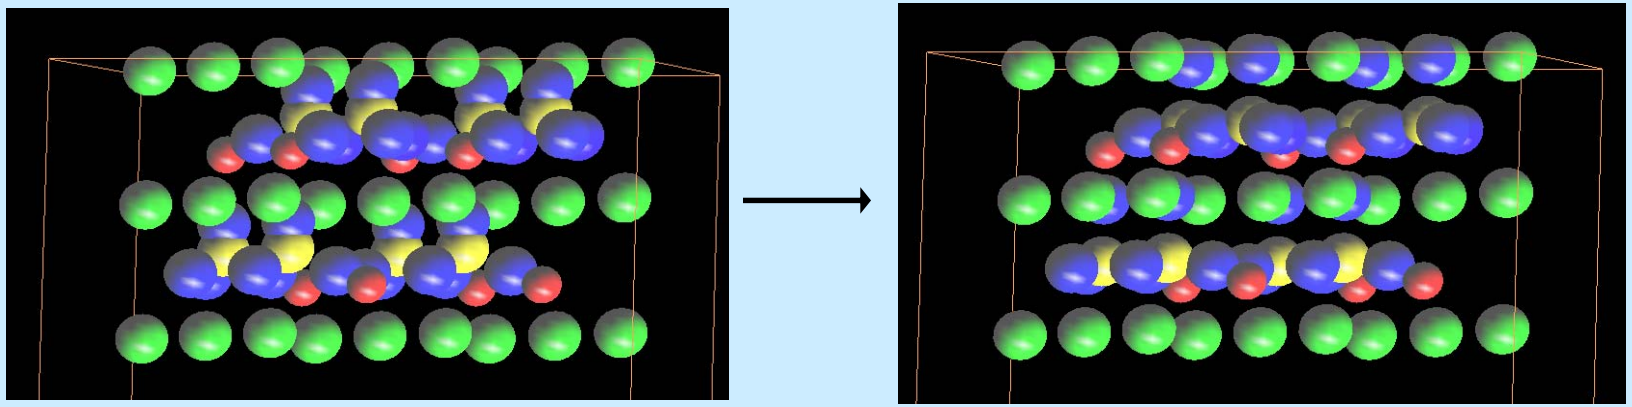


Crystal normal modes (eigenmodes)

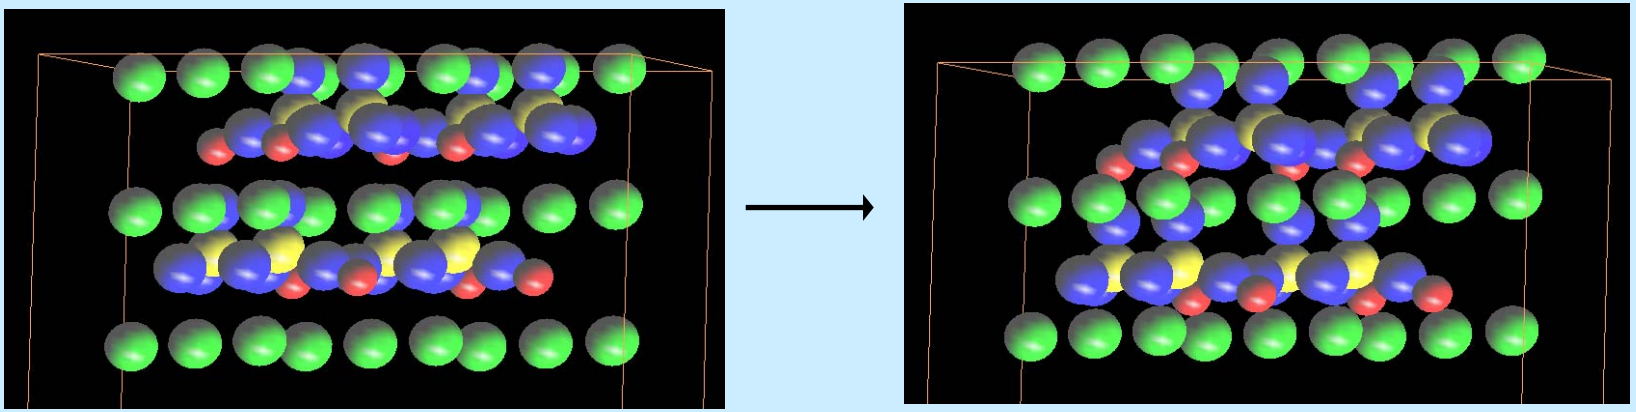
Atomic vibrations in crystals = Superposition of normal modes (eigenmodes)

e.g.,

a mode involving mainly S-O_t bond stretching



a mode involving SO_4 translations and Li motions vs K atoms

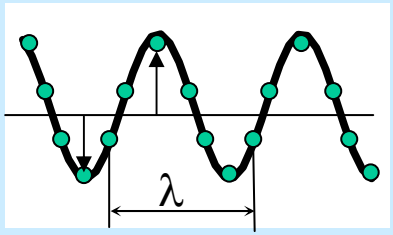


Phonons

Atomic vibrations in a *periodic* solid

⇳

standing elastic waves ≡ normal modes (ω_S, $\{\mathbf{u}_i\}_s$)



crystals : ***N*** atoms in the primitive unit cell vibrating in the ***3D*** space

⇨ 3N degrees of freedom ⇨ finite number of normal states

⇨ quantization of crystal vibrational energy

N atoms × **3** dimensions ↔ ***3N* phonons**

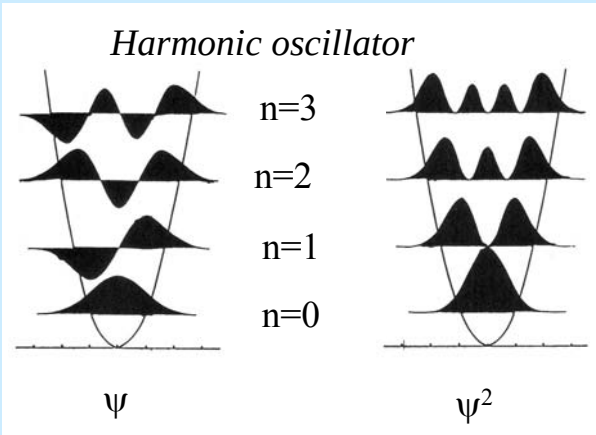
phonon ≡ quantum of crystal vibrational energy

phonons: quasi-particles (elementary excitations in solids)

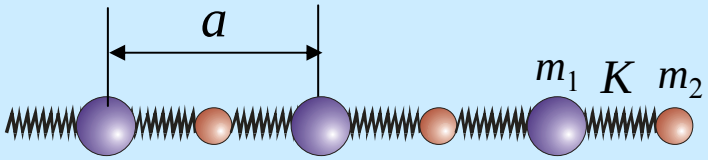
- $E_n = (n+1/2)\hbar\omega$,
- $m_0 = 0$, $\mathbf{p} = \hbar\mathbf{K}$ (quasi-momentum), $\mathbf{K} \equiv \mathbf{q} \in$ RL
- integer spin

  Bose-Einstein statistics: $n(\omega,T)= 1/[\exp(\hbar\omega/k_BT)-1]$

  (equilibrium population of phonons at temperature T)



Phonon frequencies and atom vector displacements



Atomic bonds ↔ elastic springs

Hooke's low : $m\ddot{x} = -Kx \quad \rightarrow \quad \omega = \sqrt{\frac{K}{m}}$

Equation of motion for a **3*D*** crystal with *N* atoms in the primitive unit cell :

$$\omega^2 w_{i\alpha,\mathbf{q}} = \sum_{i'\alpha'} D_{ii',\alpha\alpha'}(\mathbf{q}) w_{i'\alpha',\mathbf{q}}$$

dynamical matrix

$$w_{i\alpha,\mathbf{q}} = \frac{1}{\sqrt{m_i}} u_{i\alpha,\mathbf{q}} \qquad \alpha = 1,2,3 \quad i = 1,\ldots, N$$

atomic vector displacements

$$D_{ss'\alpha\alpha'}(\mathbf{q}) = \frac{1}{\sqrt{m_s m_{s'}}} \Phi_{ss'\alpha\alpha'}(\mathbf{q})$$

second derivatives of the crystal potential

in a matrix form: $\omega^2 \mathbf{w}_\mathbf{q} = \mathbf{D}(\mathbf{q}) \cdot \mathbf{w}_\mathbf{q}$ $\qquad \left(\mathbf{D}(\mathbf{q}) - \omega^2 \boldsymbol{\delta}\right) \cdot \mathbf{w}_\mathbf{q} = 0$

(3*N*×1) (3*N*×3*N*) (3*N*×1)

⇨ phonon ω_S, $\{\mathbf{u}_i\}_s$ ↔ eigenvalues and eigenvectors of $\mathbf{D} = f\,(m_i, K(\{\mathbf{r}_i\}), \{\mathbf{r}_i\})$

⇨ phonon ω_S, $\{\mathbf{u}_i\}_s$ carry essential structural information !

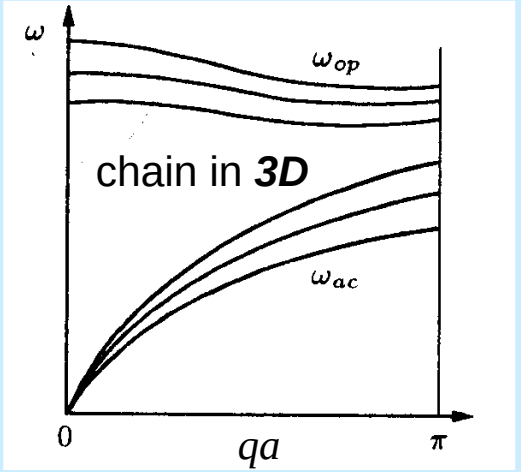
Types of phonons

diatomic chain

Acoustic phonon: $\mathbf{u}_1$, $\mathbf{u}_2$, in-phase

Optical phonon: $\mathbf{u}_1$, $\mathbf{u}_2$, out-of-phase

phonon dispersion: $\omega_{ac}(\mathbf{q}) \neq \omega_{op}(\mathbf{q})$, for $q \approx 0$, $\omega_{op} > \omega_{ac}$



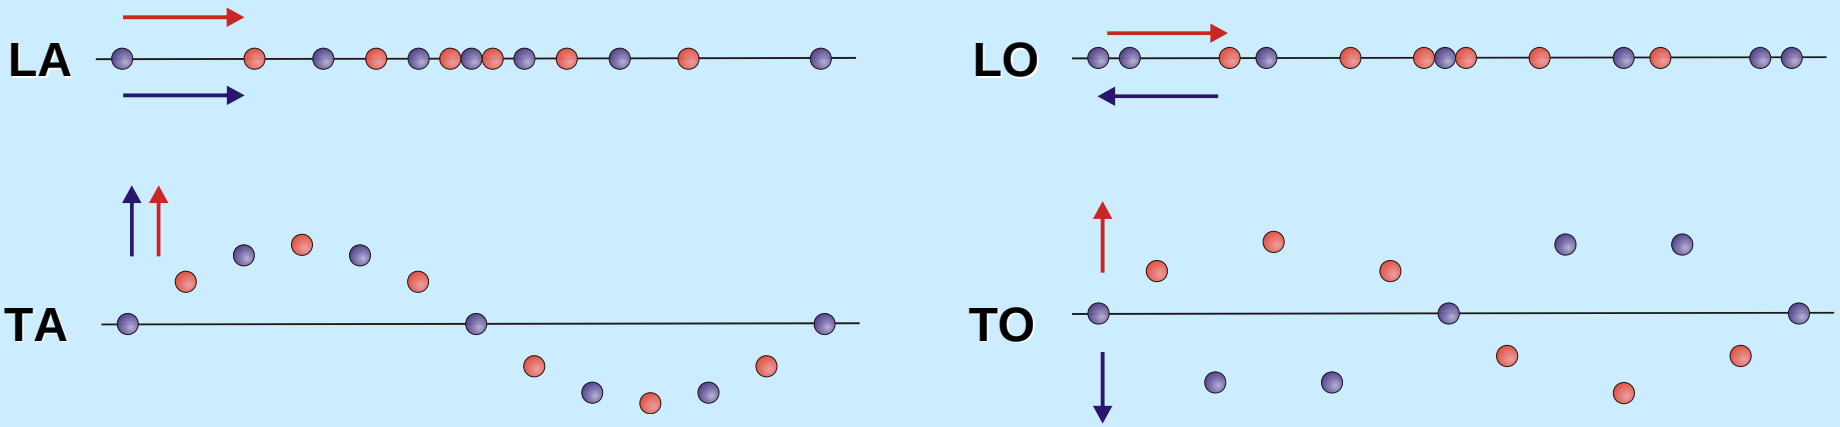
3*D* crystal with ***N*** atoms per cell :

3 acoustic and **3*N* – 3** optical phonons

induced dipole moment
⇨ *interact with light*

1 Longitudinal: wave polarization ($\mathbf{u}$) || wave propagation ($\mathbf{q}$)

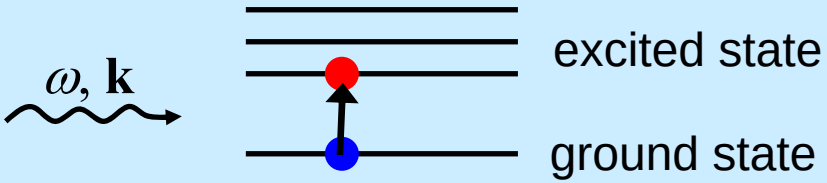
2 Transverse: wave polarization ($\mathbf{u}$) ⊥ wave propagation ($\mathbf{q}$)

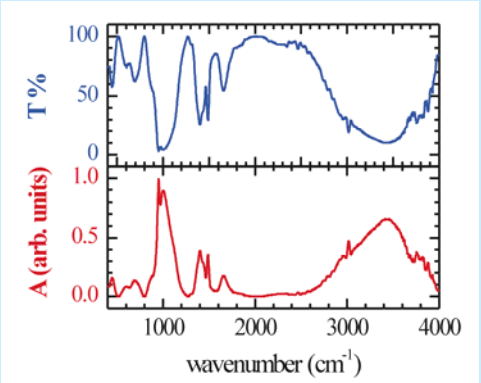


Phonon (Raman and IR) spectroscopy

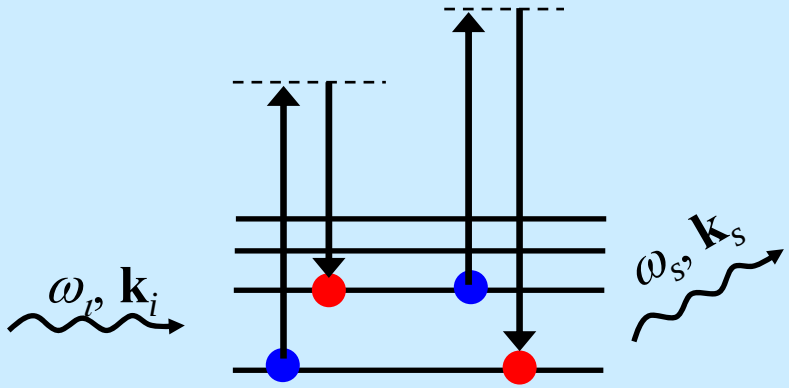
electromagnetic wave as a probe radiation (***photon – opt. phonon interaction***):

Infrared absorption: $\hbar\omega_{photon} = E_{ES}^{(phonon)} - E_{GS}^{(phonon)}$



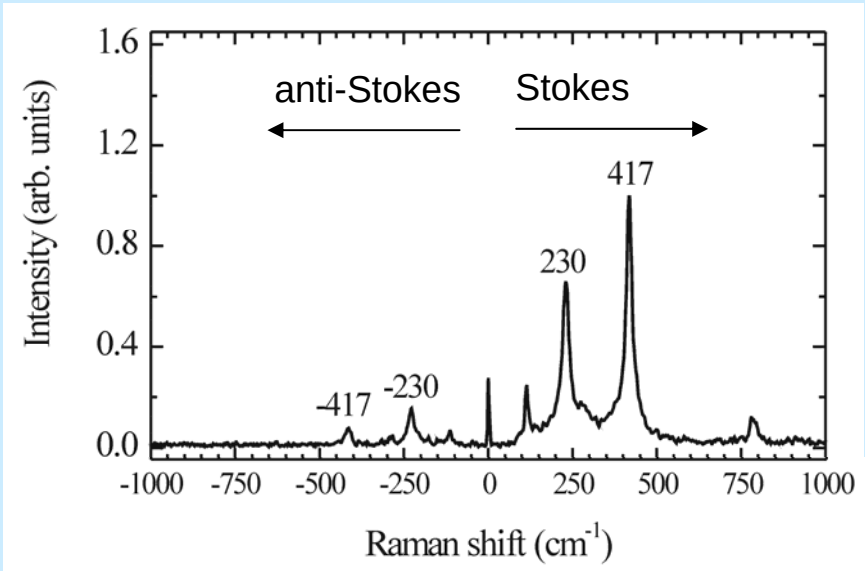


Raman scattering ≡ inelastic light scattering from optical phonons



Stokes $\omega_s = \omega_i - \Omega$ $\mathbf{k}_s = \mathbf{k}_i - \mathbf{K}$

anti-Stokes $\omega_s = \omega_i + \Omega$ $\mathbf{k}_s = \mathbf{k}_i + \mathbf{K}$



Phonon (Raman and IR) spectroscopy

- only optical phonons near the FBZ centre are involved

$\mathbf{k}_i - \mathbf{k}_s = \mathbf{K}$ ⇨ $K_{\max} = \Delta k \approx 2k_i$ (e.g. Raman, 180°-scattering geometry)

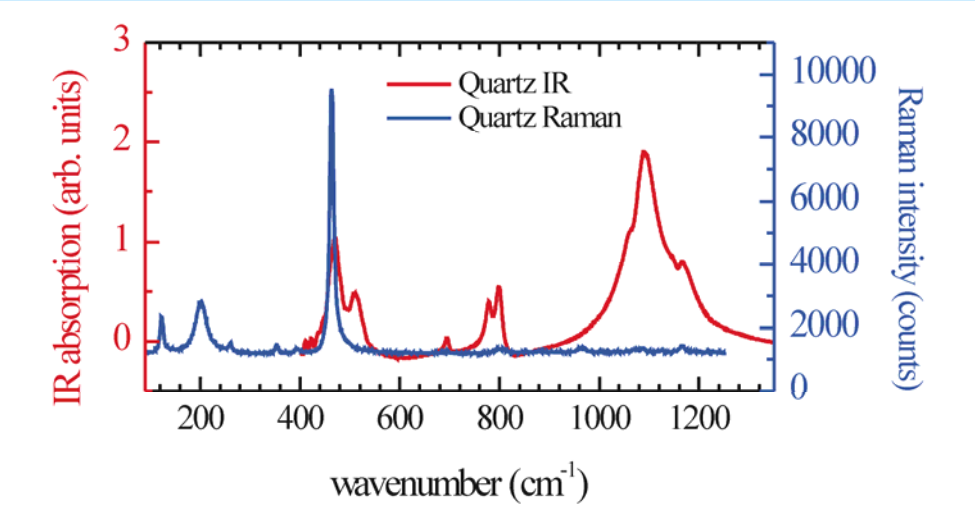
λ_i (IR, vis, UV) ~ $10^3 - 10^5$ Å ⇨ $k_i \sim 10^{-5} - 10^{-3}$ Å $\approx K_{\max}$ ⇨ $K_{\max} << \frac{\pi}{a}$ ($a \sim 10$ Å)

⇨ photon-phonon interaction only for $K \approx 0$

- spectroscopic units: cm^{-1} ⇔ $E = \hbar ck = \hbar c(2\pi/\lambda) = hc(1/\lambda)$

10 [cm^{-1}] ⇔ 1.24 [meV] 10 [cm^{-1}] ⇔ 0.30 [THz] [Å].[cm^{-1}] = 10^8

- IR and Raman spectra are different for the same crystal



different interaction phenomena ⇨ different selection rules !

Raman and IR intensities

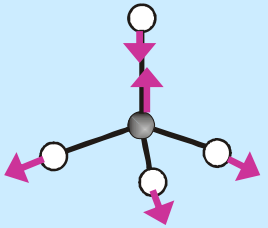
IR activity: induced dipole moment due to the change in the atomic positions

$$\boldsymbol{\mu} = (\mu_x, \mu_y, \mu_z)$$

$$\boldsymbol{\mu}(Q) = \boldsymbol{\mu}_0 + \sum \frac{\partial \boldsymbol{\mu}}{\partial Q_k} Q_k + \ldots$$

Q_k – configurational coordinate

$\neq 0$, IR activity



IR: “asymmetrical”, “one-directional”

Raman activity: induced dipole moment due to deformation of the e^- shell

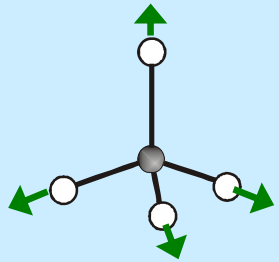
Polarizability tensor: $\boldsymbol{\alpha} = \begin{pmatrix} \alpha_{xx} & \alpha_{xy} & \alpha_{xz} \\ \alpha_{xy} & \alpha_{yy} & \alpha_{yz} \\ \alpha_{xz} & \alpha_{yz} & \alpha_{zz} \end{pmatrix}$

$$\mathbf{P} = \boldsymbol{\alpha}.\mathbf{E}$$

induced polarization
(dipole moment per unit cell)

$$\boldsymbol{\alpha}(Q) = \boldsymbol{\alpha}_0 + \sum \frac{\partial \boldsymbol{\alpha}}{\partial Q_k} Q_k + \ldots$$

$\neq 0$, Raman activity



Raman: “symmetrical”, “two-directional”

N.B.! simultaneous IR and Raman activity – only in non-centrosymmetric structures

Raman and IR activity in crystals

Isolated TO_4 group ⟶ **Crystal: $Pb_3(PO_4)_2$, $R\bar{3}m$**

Methods for normal phonon mode determination

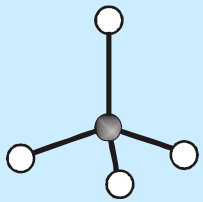
Three techniques of selection rule determination at the Brillouin zone centre:

- Factor group analysis

  the effect of each symmetry operation in the factor group on each type of atom in the unit cell

- Molecular site group analysis

  symmetry analysis of the ionic group (molecule) → site symmetry of the central atom + factor group symmetry



✓ • **Nuclear site group analysis**

site symmetry analysis is carried out on every atom in the unit cell
☺ *set of tables ensuring a great ease in selection rule determination*
preliminary info required: space group and occupied Wyckoff positions

Rousseau, Bauman & Porto, J. Raman Spectrosc. **10**, (1981) 253-290

✓ **Bilbao Server, SAM,** http://www.cryst.ehu.es/rep/sam.html

N.B.! Tabulated information for:

first-order, **linear-response**, **non-resonance** interaction processes

(*one phonon only*) (*one photon only*) ($\hbar\omega_i < E_{ES}^{electron} - E_{GS}^{electron}$)

Symbols and notations

Symmetry element	Schönflies notation	International (Hermann-Mauguin)
Identity	E	1
Rotation axes	C_n	$n = 1, 2, 3, 4, 6$
Mirror planes	σ	m
$\perp$ to n-fold axis	σ_h	m, m_z
$\parallel$ to n-fold axis	σ_v	m_v,
bisecting $\angle(2,2)$	σ_d	m_d, m'
Inversion	I	$\bar{1}$
Rotoinversion axes	S_n	$n = \bar{1},\bar{2},\bar{3},\bar{4},\bar{6}$
Translation	t_n	t_n
Screw axes	C_n^k	n_k
Glide planes	σ^g	a, b, c, n, d

Point groups:

Triclinic		Monoclinic		Trigonal (Rhombohedral)		Tetragonal		Hexagonal		Cubic	
C_1	1	C_2	2	C_3	3	C_4	4	C_6	6	T	23
C_i	$\bar{1}$	C_S	m	C_{3i}	$\bar{3}$	S_4	$\bar{4}$	C_{3h}	$\bar{6}$		
		C_{2h}	$2/m$			C_{4h}	$4/m$	C_{6h}	$6/m$	T_h	$m\bar{3}$
		C_{2v}	$mm2$	C_{3v}	$3m$	C_{4v}	$4mm$	C_{6v}	$6mm$		
				D_{3d}	$\bar{3}m$	D_{2d}	$42m$	D_{3h}	$6m2$	T_d	$\bar{4}3m$
		D_2	222	D_3	32	D_4	422	D_6	622	O	432
		D_{2h}	mmm			D_{4h}	$4/mmm$	D_{6h}	$6/mmm$	O_h	$m\bar{3}m$

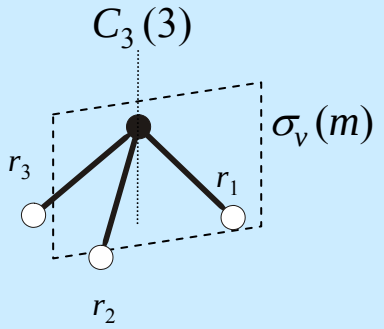
D_n: E, C_n; $nC_2 \perp$ to C_n; T: tetrahedral symmetry; O: octahedral (cubic) symmetry

Symbols and notations

normal phonon modes ↔ irreducible representations

Reminder: Symmetry element: matrix representation **A**

Character: $\mathrm{Tr}(\mathbf{A}) = \sum_i A_{ii}$



Point group C_{3v} (3m)		1	3	m
reducible		3	0	1
irreducible	A_1	1	1	1
	E	2	-1	0
	$A_1 + E$	3	0	1

characters

Mulliken symbols

$$1: \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \rightarrow \left(\begin{array}{c|cc} 1 & 0 & 0 \\ \hline 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right)$$

$$3: \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{pmatrix} \rightarrow \left(\begin{array}{c|cc} 1 & 0 & 0 \\ \hline 0 & -\frac{1}{2} & \frac{\sqrt{3}}{2} \\ 0 & -\frac{\sqrt{3}}{2} & -\frac{1}{2} \end{array}\right)$$

$$m: \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix} \rightarrow \left(\begin{array}{c|cc} 1 & 0 & 0 \\ \hline 0 & 1 & 0 \\ 0 & 0 & -1 \end{array}\right)$$

reducible *irreducible (block-diagonal)*

Mulliken symbols

A, B : **1*D*** representations ↔ non-degenerate (single) mode

only one set of atom vector displacements ($\mathbf{u}_1$, $\mathbf{u}_2$,…,$\mathbf{u}_N$) for a given wavenumber ω

A: symmetric with respect to the principle rotation axis n (C_n)

B: anti-symmetric with respect to the principle rotation axis n (C_n)

E: **2*D*** representation ↔ doubly degenerate mode

two sets of atom vector displacements ($\mathbf{u}_1$, $\mathbf{u}_2$,…,$\mathbf{u}_N$) for a given wavenumber ω

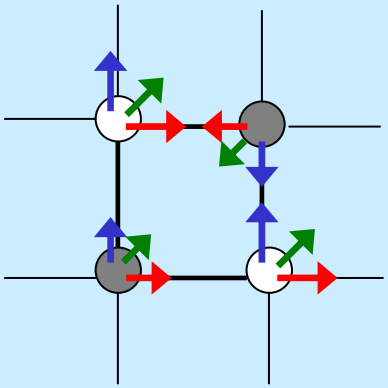
T (F): **3*D*** representation ↔ triply degenerate mode

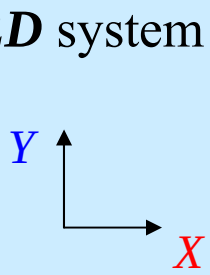
three sets of atom vector displacements ($\mathbf{u}_1$, $\mathbf{u}_2$,…,$\mathbf{u}_N$) for a given wavenumber ω

subscripts g, u (X_g, X_u) : symmetric or anti-symmetric to inversion $\bar{1}$

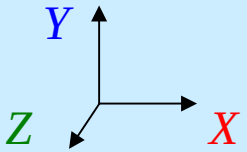
superscripts ’,” (X’, X”) : symmetric or anti-symmetric to a mirror plane m

subscripts 1,2 (X_1, X_2) : symmetric or anti-symmetric to add. m or C_n





E mode



T mode

IR and Raman Modes

Symmetry Adapted Modes

Given a space group in ITA notation and selected the Wyckoff positions for the atoms in a structure the program calculates the symmetry adapted modes for gamma point and classifies them in IR

Please, enter the sequential number of group as given in *International Tables for Crystallography*, Vol. A or choose it: 167

Select Wyckoff Positions

or input, then click

Bilbao Crystallographic Server, SAM

$\boldsymbol{\mu} = (0,\mu_y,0)$

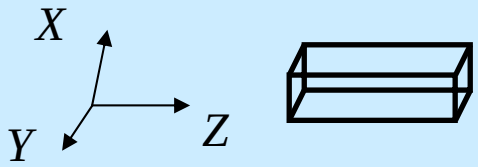
Experimental geometry

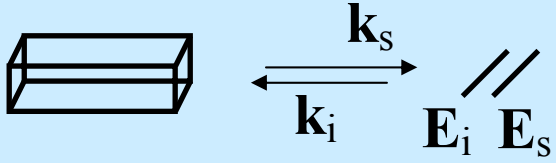
non-cubic system

e.g., trigonal, C_{3v} ($3m$)

A_1,z			E,x			E,y		
a	·	·	c	·	d	·	-c	·
·	a	·	·	-c	·	-c	·	d
·	·	b	d	·	·	·	d	·

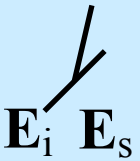
(hexagonal setting)



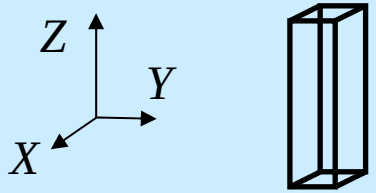


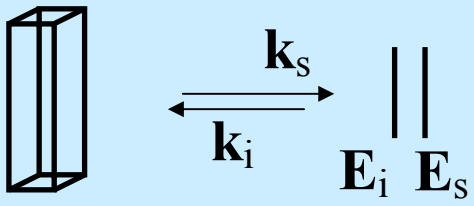
$\bar{Z}(YY)Z$ α^{z}_{yy} $\mathbf{\mu}=(0,0,\mu_z)$, $\mathbf{q}=(0,0,q_z)$ → A_1(LO)

α^{x}_{yy} → $\mathbf{\mu}=(\mu_x,0,0)$ → E(TO)

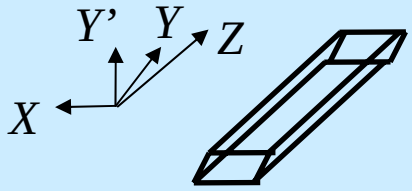


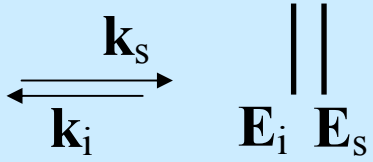
$\bar{Z}(YX)Z$ α^{y}_{xy} $\mathbf{\mu}=(0,\mu_y,0)$, $\mathbf{q}=(0,0,q_z)$ E(TO)





$\bar{Y}(ZZ)Y$ α^{z}_{zz} $\mathbf{\mu}=(0,0,\mu_z)$, $\mathbf{q}=(0,q_y,0)$ A_1(TO)





$X(Y'Y')\bar{X}$ α^{x}_{yy} $\mathbf{\mu}=(\mu_x,0,0)$, $\mathbf{q}=(q_x,0,0)$ E(LO)

contribution from → α^{z}_{yy} → $\mathbf{\mu}=(0,0,\mu_z)$ → A_1(TO)

LO-TO splitting

More peaks than predicted by GTA may be observed *(info is tabulated)*

Cubic systems: LO-TO splitting of T modes: T(LO) + T(TO)

Non-cubic systems: {A(LO) ,A(TO)}; {B(LO),B(TO)}; {E(LO),E(TO)}

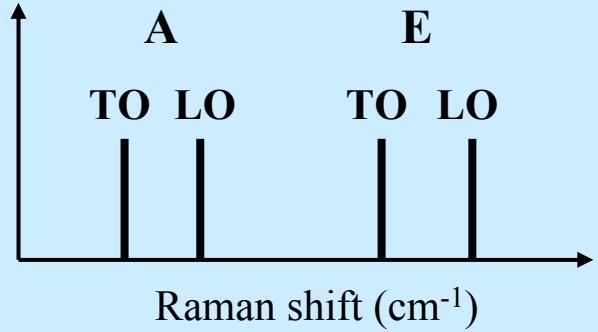
general rule: $\omega(LO) > \omega(TO)$ (*the potential for* LO: U+E; *for* TO: U)

Cubic crystals: LO-TO splitting ⇔ covalency of atomic bonding

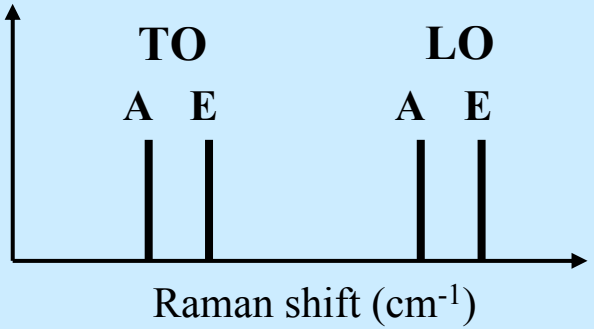
$\Delta\omega_{\text{LO-TO}}$: larger in ionic crystals, smaller in covalent crystals

Uniaxial crystals:

if **short-range** forces dominate:



if **long-range** forces dominate :



under certain propagation and polarization conditions →

quasi-LO and **quasi-TO** phonons of **mixed** A-E character

LO-TO splitting

LO-TO splitting: sensitive to local polarization fields induced by point defects

$I23$ (T_0^3)

Bi(24*f*), Si(2*a*),
O1(27*f*),
O2(8*c*), O3(8*c*)

a change in I_{LO}/I_{TO} depending on type and concentration of dopant

One-mode / two-mode behaviour in solid solutions

different types of atoms in the same crystallogr. position, e.g. $(B'_{1-x}B''_{x})O_y$

two-mode behaviour:

- two peaks corresponding to "pure" *B'*-O and *B"*-O phonon modes
- intensity ratio I(*B'*-O)/I(*B"*-O) depends on *x*

  ✓ covalent character of chemical bonding : short correlation length
  ✓ relatively large difference in *f*(*B'*/*B"*-O) and/or *m*(*B'*/*B"*)

one-mode behaviour:

- one peak corresponding to the mixed *B'*-O/*B"*-O phonon mode
- ~ lineal dependence of the peak position ω on dopant concentration *x*

  ✓ ionic character of chemical bonding : long correlation length
  ✓ similarity in r_i(*B'*/*B"*), *f*(*B'*/*B"*-O) and *m*(*B'*/*B"*)

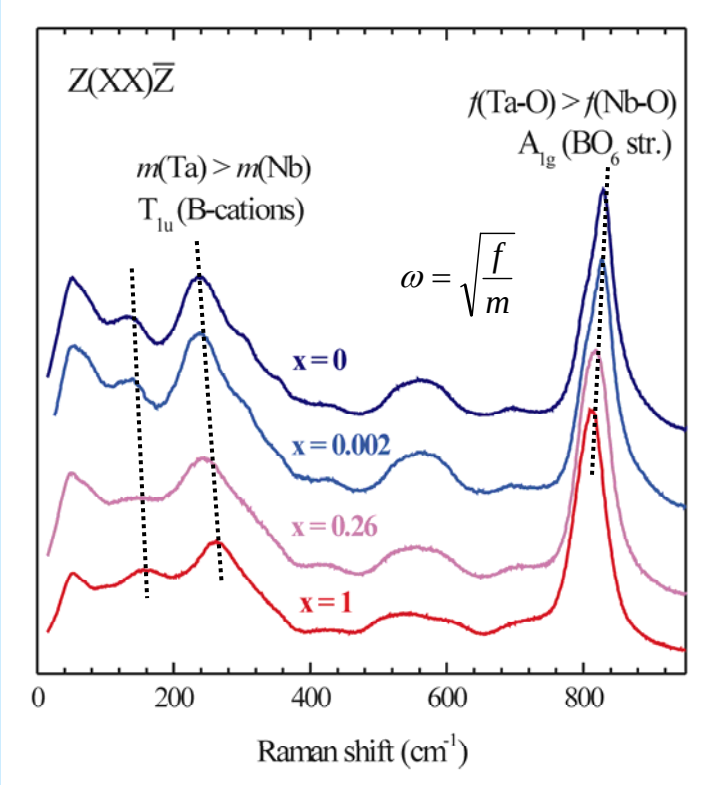
intermediate classes of materials:

two-mode over $x \in (0, x_m)$ and one-mode over $x \in (x_m, 1)$

One-mode / two-mode behaviour in solid solutions

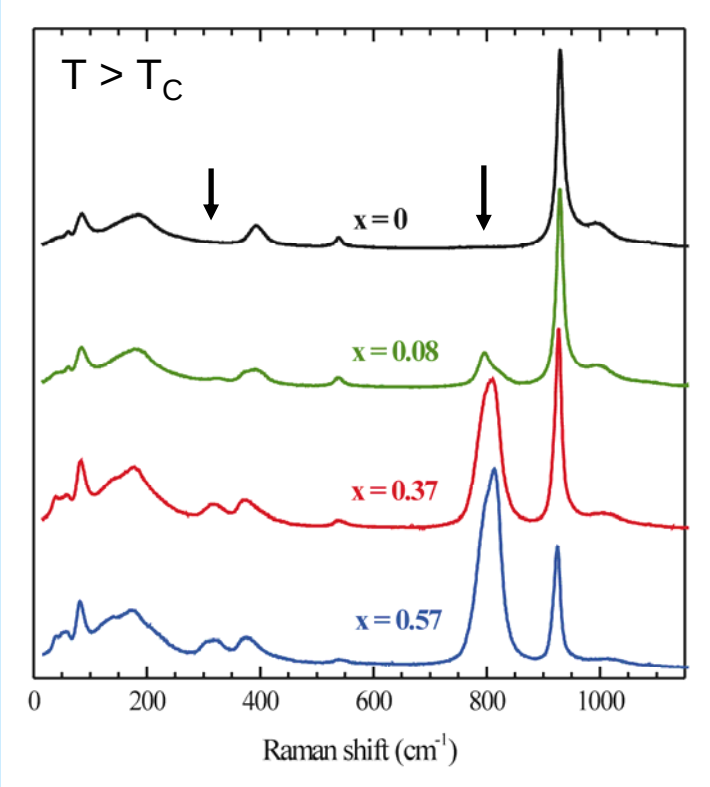
one-mode behaviour

$PbSc_{0.5}(Ta_{1-x}Nb_x)_{0.5}O_3$



two-mode behaviour

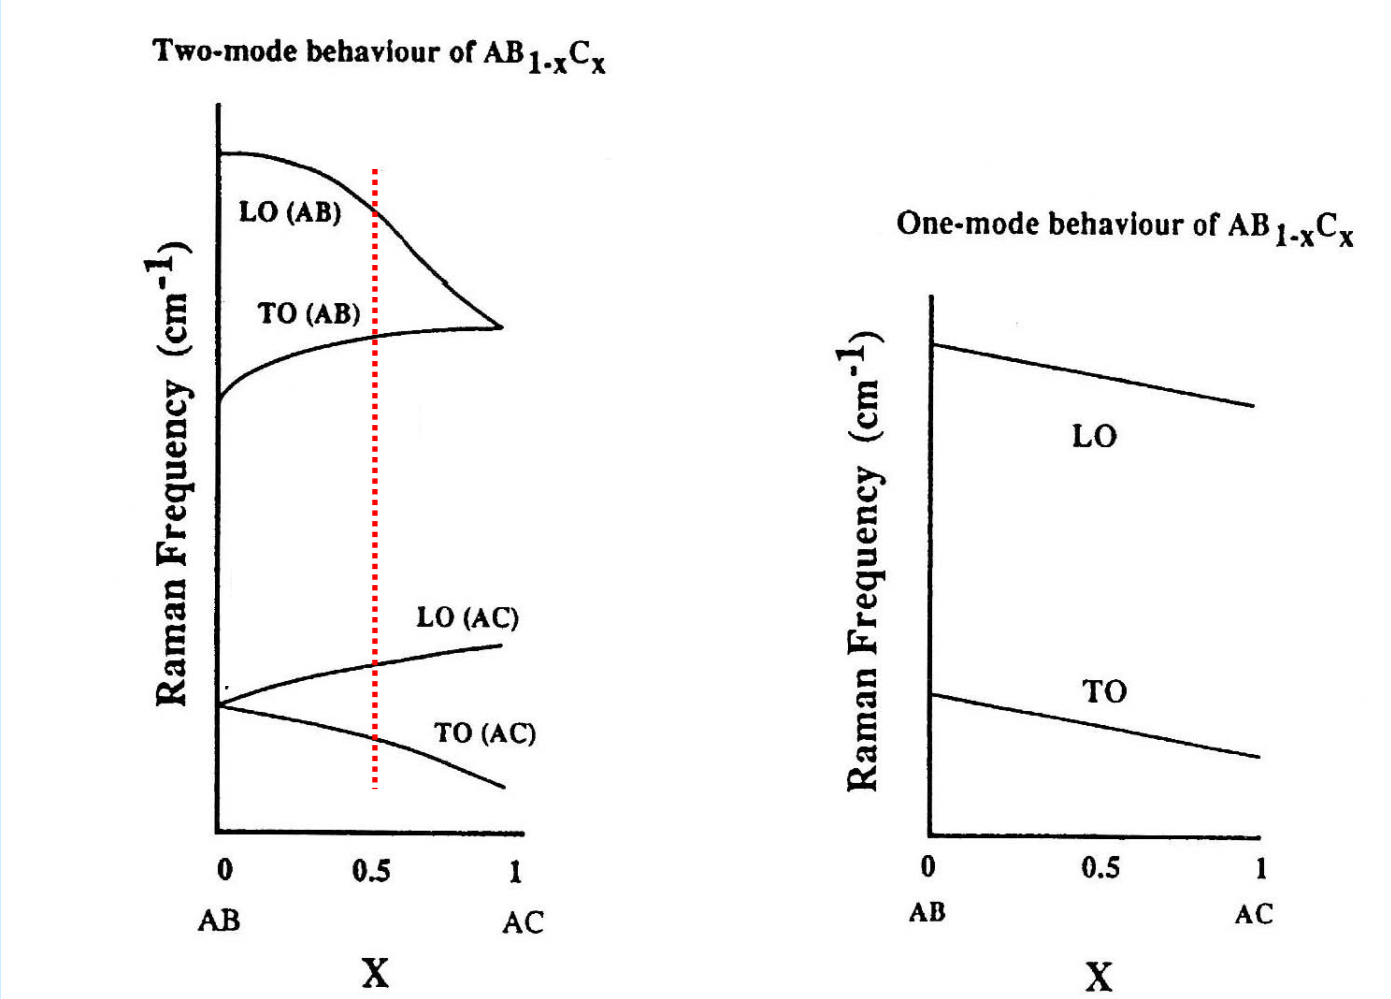
$Pb_3[(P_{1-x}As_x)O_4]_2$



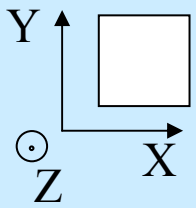
Non-centrosymmetric crystals with compositional disorder

LO-TO splitting + one-mode/**two-mode** behaviour:

we may observe **four** peaks instead of **one** !



Transformation of polarizability tensors

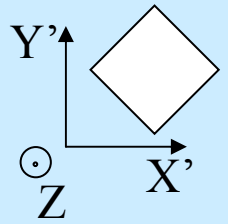


$$\begin{pmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{pmatrix}$$

$$\text{rot}_Z(\varphi=45°)$$

$$\alpha' = U^T \alpha U$$

$$\begin{pmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & a \end{pmatrix}$$

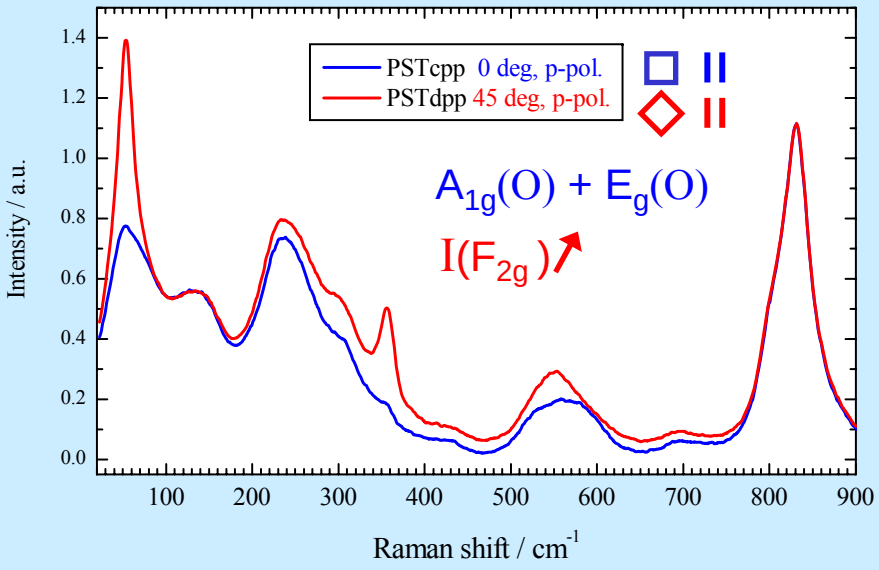


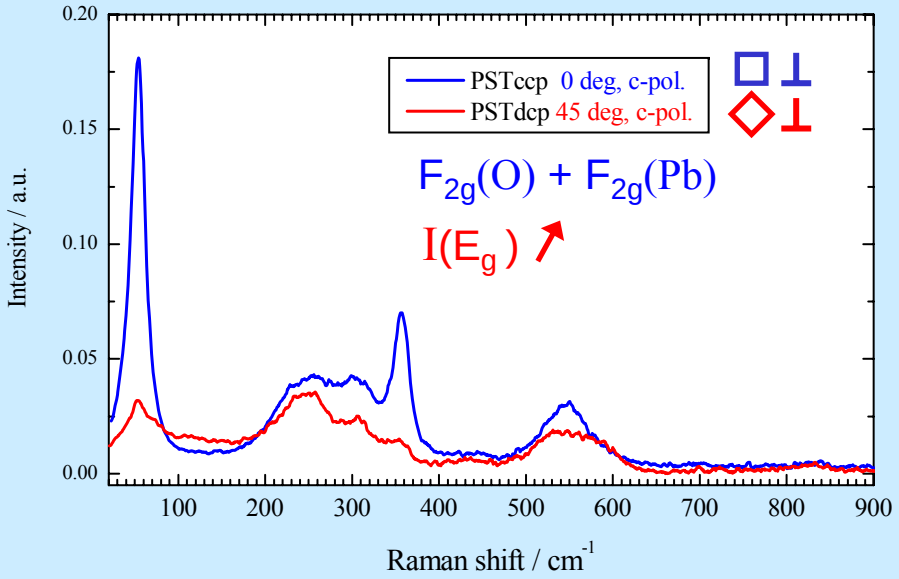
$$\begin{pmatrix} b & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & -2b \end{pmatrix} \quad \begin{pmatrix} \sqrt{3}b & 0 & 0 \\ 0 & -\sqrt{3}b & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\begin{pmatrix} b & 0 & 0 \\ 0 & b & 0 \\ 0 & 0 & -2b \end{pmatrix} \quad \begin{pmatrix} 0 & -\sqrt{3}b & 0 \\ -\sqrt{3}b & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\begin{pmatrix} 0 & d & 0 \\ d & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \quad \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & d \\ 0 & d & 0 \end{pmatrix} \quad \begin{pmatrix} 0 & 0 & d \\ 0 & 0 & 0 \\ d & 0 & 0 \end{pmatrix}$$

$$\begin{pmatrix} 0 & 0 & \frac{d}{\sqrt{2}} \\ 0 & 0 & \frac{d}{\sqrt{2}} \\ \frac{d}{\sqrt{2}} & \frac{d}{\sqrt{2}} & 0 \end{pmatrix} \quad \begin{pmatrix} 0 & 0 & \frac{d}{\sqrt{2}} \\ 0 & 0 & -\frac{d}{\sqrt{2}} \\ \frac{d}{\sqrt{2}} & -\frac{d}{\sqrt{2}} & 0 \end{pmatrix} \quad \begin{pmatrix} d & 0 & 0 \\ 0 & -d & 0 \\ 0 & 0 & 0 \end{pmatrix}$$





Conclusions

Group theory: predicts the number of expected IR and Raman peaks

one needs to know: crystal space symmetry + occupied Wyckoff positions

Deviations from the predictions of the group-theory analysis:

- ☺ LO-TO splitting if no centre of inversion (info included in the tables)
- ☺ one-mode – two-mode behaviour in solid solutions
- ☺☺☺ local structural distortions (length scale ~ 2-3 nm, time scale ~ 10^{-12} s)
- ☹ Experimental difficulties (low-intensity peaks, hardly resolved peaks)

What should we do before performing a Raman or IR experiment?
